For Immediate Release

Argonics' Drum Liner "Evolves"

MARQUETTE, Mich. – Argonics, Inc. has made a dramatic change to its drum liner, moving from a dual-durometer style to a single, multi-plate enforced mixer liner. This new liner, Kryptane® Evolution™, provides a single layer guaranteed not to delaminate.

Delamination in mixer drums is an industry-wide problem, but the Kryptane Evolution utilizes an entirely new manufacturing process to eliminate this issue. "It's no secret, the industry has experienced problems with liner delamination in the past," said Bob Welker, Sales and Marketing Manager for Argonics. "We wanted to be proactive in finding a solution to the problem and have spent the better part of a year working on this issue."

The new manufacturing process used to make the Evolution is a complete departure from Argonics' standard liner manufacturing process. "I'm very proud of everyone on our staff who worked together to develop this new technique," said Welker. "I am very excited to offer this improved product to our customers."

The Evolution also carries a five-year or one million yard warranty. If any section of the liner delaminates within this time, that section will be replaced for free.
